(54) Title: THERAPEUTIC COMPOUNDS

(57) Abstract: The present invention provides compounds of formula (I): pharmaceutical compositions containing the same, processes for preparing the same and their use as pharmaceutical agents.

52

## THERAPEUTIC COMPOUNDS

### BACKGROUND OF THE INVENTION

5 The present invention relates to novel compounds, pharmaceutical formulations comprising these compounds, and the use of these compounds in therapy. More particularly, the present invention relates to compounds for the prophylaxis and treatment of herpes viral infections.

10 Of the DNA viruses, those of the herpes group are the sources of the most common viral illnesses in man. The group includes herpes simplex virus types 1 and 2 (HSV), varicella zoster virus (VZV), cytomegalovirus (CMV), Epstein-Barr virus (EBV), human herpes virus type 6 (HHV-6), human herpes virus type 7 (HHV-7) and human herpes virus type 8 (HHV-8). HSV-1 and HSV-2 are some of the most common infectious  
15 agents of man. Most of these viruses are able to persist in the host's neural cells; once infected, individuals are at risk of recurrent clinical manifestations of infection which can be both physically and psychologically distressing.

Herpes simplex viruses (HSV-1 and -2) are the causative agents of herpes labialis and  
20 genital herpes. HSV infection is often characterised by extensive and debilitating lesions of the skin, mouth and/or genitals. Primary infections may be subclinical although tend to be more severe than infections in individuals previously exposed to the virus. Ocular infection by HSV can lead to keratitis or cataracts thereby endangering the host's sight. Infection in the new-born, in immunocompromised  
25 patients or penetration of the infection into the central nervous system can prove fatal. In the US alone, 40 million individuals are infected with HSV-2, a number that is expected to increase to 60 million by 2007. Over 80% of individuals infected with HSV-2 are unaware they carry and spread the virus, and of those diagnosed less than 20% received oral therapies. The net result is that less than 5% of the infected  
30 population are treated. Likewise of the 530 million individuals worldwide who carry the HSV-1 virus, 81% of the symptomatic population remain untreated. No cure

exists for HSV infection, and once infected, individuals carry the virus for life in a dormant state. Reactivation of the virus from latency occurs periodically and may be triggered by stress, environmental factors, and/or suppression of the host immune system. Currently, the use of nucleoside analogs such as valaciclovir (VALTREX®) and aciclovir (ZOVIRAX®) is the standard of care for managing genital herpes virus outbreaks.

VZV is a herpes virus which causes chickenpox and shingles. Chickenpox is the primary disease produced in a host without immunity, and in young children is usually a mild illness characterised by a vesicular rash and fever. Shingles or zoster is the recurrent form of the disease which occurs in adults who were previously infected with VZV. The clinical manifestations of shingles are characterised by neuralgia and a vesicular skin rash that is unilateral and dermatomal in distribution. Spread of inflammation may lead to paralysis or convulsions. Coma can occur if the meninges become affected. VZV is of serious concern in patients receiving immunosuppressive drugs for transplant purposes or for treatment of malignant neoplasia and is a serious complication of AIDS patients due to their impaired immune system.

In common with other herpes viruses, infection with CMV leads to a lifelong association of virus and host. Congenital infection following infection of the mother during pregnancy may give rise to clinical effects such as death or gross disease (microcephaly, hepatosplenomegaly, jaundice, mental retardation), retinitis leading to blindness or, in less severe forms, failure to thrive, and susceptibility to chest and ear infections. CMV infection in patients who are immunocompromised for example as a result of malignancy, treatment with immunosuppressive drugs following transplantation or infection with Human Immunodeficiency Virus, may give rise to retinitis, pneumonitis, gastrointestinal disorders and neurological diseases. CMV infection is also associated with cardiovascular diseases and conditions including restenosis and atherosclerosis.

The main disease caused by EBV is acute or chronic infectious mononucleosis (glandular fever). Examples of other EBV or EBV associated diseases include lymphoproliferative disease which frequently occurs in persons with congenital or acquired cellular immune deficiency, X-linked lymphoproliferative disease which occurs namely in young boys, EBV-associated B-cell tumours, Hodgkin's disease, nasopharyngeal carcinoma, Burkitt lymphoma, non-Hodgkin lymphoma, thymomas and oral hairy leukoplakia. EBV infections have also been found in association with a variety of epithelial-cell-derived tumours of the upper and lower respiratory tracts including the lung. EBV infection has also been associated with other diseases and conditions including chronic fatigue syndrome and multiple sclerosis.

HHV-6 has been shown to be a causative agent of infantum subitum in children and of kidney rejection and interstitial pneumonia in kidney and bone marrow transplant patients, respectively, and may be associated with other diseases such as multiple sclerosis. There is also evidence of repression of stem cell counts in bone marrow transplant patients. HHV-7 is of undetermined disease aetiology.

Hepatitis B virus (HBV) is a viral pathogen of world-wide major importance. The virus is aetiologically associated with primary hepatocellular carcinoma and is thought to cause 80% of the world's liver cancer. Clinical effects of infection with HBV range from headache, fever, malaise, nausea, vomiting, anorexia and abdominal pains. Replication of the virus is usually controlled by the immune response, with a course of recovery lasting weeks or months in humans, but infection may be more severe leading to persistent chronic liver disease outlined above.

- 25 and pharmaceutically acceptable salts, solvates and physiologically functional derivatives thereof.

It will be appreciated by those skilled in the art that the compounds of the present invention may also be utilized in the form of a pharmaceutically acceptable salt or solvate thereof. The pharmaceutically acceptable salts of the compounds of formula (I) include conventional salts formed from pharmaceutically acceptable inorganic or

30

organic acids or bases as well as quaternary ammonium salts. More specific examples of suitable acid salts include hydrochloric, hydrobromic, sulfuric, phosphoric, nitric, perchloric, fumaric, acetic, propionic, succinic, glycolic, formic, lactic, maleic, tartaric, citric, palmoic, malonic, hydroxymaleic, phenylacetic, glutamic, benzoic, salicylic, fumaric, toluenesulfonic, methanesulfonic, naphthalene-2-sulfonic, benzenesulfonic, hydroxynaphthoic, hydroiodic, malic, steroic, tannic and the like. Other acids such as oxalic, while not in themselves pharmaceutically acceptable, may be useful in the preparation of salts useful as intermediates in obtaining the compounds of the invention and their pharmaceutically acceptable salts. More specific examples of suitable basic salts include sodium, lithium, potassium, magnesium, aluminium, calcium, zinc, N,N'-dibenzylethylenediamine, chlorprocaine, choline, diethanolamine, ethylenediamine, N-methylglucamine and procaine salts.

The term "solvate" as used herein refers to a complex of variable stoichiometry formed by a solute (a compound of formula (I)) and a solvent. Solvents, by way of example, include water, methanol, ethanol, or acetic acid. Hereinafter, reference to a compound of formula (I) is to the amorphous form of that compound, unless another form or solvate thereof is specified.

The term "physiologically functional derivative" as used herein refers to any pharmaceutically acceptable derivative of a compound of the present invention, for example, an ester or an amide, which upon administration to a mammal, such as a human, is capable of providing (directly or indirectly) such a compound or an active metabolite thereof. Such derivatives are clear to those skilled in the art, without undue experimentation, and with reference to the teaching of Burger's Medicinal Chemistry And Drug Discovery, 5th Edition, Vol 1: Principles And Practice.

Processes for preparing pharmaceutically acceptable salts, solvates and physiologically functional derivatives of the compounds of formula (I) are conventional in the art. See, e.g., Burger's Medicinal Chemistry And Drug Discovery 5th Edition, Vol 1: Principles And Practice.

As will be apparent to those skilled in the art, in the processes described below for the preparation of compounds of formula (I), certain intermediates (including but not limited to compounds of formula (IX), (XVI), (XX), (XXII), (XXII-A) and (XXII-B), may be in the form of pharmaceutically acceptable salts, solvates or physiologically functional derivatives of the compound. Those terms as applied to any intermediate employed in the process of preparing compounds of formula (I) have the same meanings as noted above with respect to compounds of formula (I). Processes for preparing pharmaceutically acceptable salts, solvates and physiologically functional derivatives of such intermediates are known in the art and are analogous to the process for preparing pharmaceutically acceptable salts, solvates and physiologically functional derivatives of the compounds of formula (I).

Certain compounds of formula (I) may exist in stereoisomeric forms (e.g. they may contain one or more asymmetric carbon atoms or may exhibit *cis-trans* isomerism). The individual stereoisomers (enantiomers and diastereomers) and mixtures of these are included within the scope of the present invention. The present invention also covers the individual isomers of the compounds represented by formula (I) as mixtures with isomers thereof in which one or more chiral centers are inverted. Likewise, it is understood that compounds of formula (I) may exist in tautomeric forms other than that shown in the formula and these are also included within the scope of the present invention.

The present invention further provides compounds of formula (I) for use in medical therapy, e.g. in the treatment or prophylaxis, including suppression of recurrence of symptoms, of a viral disease in an animal, e.g. a mammal such as a human. The compounds of formula (I) are especially useful for the treatment or prophylaxis of viral diseases such as herpes viral infections. Herpes viral infections include, for example, herpes simplex virus 1 (HSV-1), herpes simplex virus 2 (HSV-2), cytomegalovirus (CMV), Epstein Barr virus (EBV), herpes zoster virus (HZV), human herpes virus 6 (HHV-6), human herpes virus 7 (HHV-7), and human herpes virus 8

(HHV-8). Compounds of the invention are also useful in the treatment or prophylaxis of the symptoms or effects of herpes virus infections.

The compounds of the invention are useful in the treatment or prophylaxis of  
5 conditions or diseases associated with herpes virus infections, particularly conditions  
or diseases associated with latent herpes virus infections in an animal, e.g., a mammal  
such as a human. By conditions or diseases associated with herpes viral infections is  
meant a condition or disease, excluding the viral infection per se, which results from  
the presence of the viral infection, such as chronic fatigue syndrome which is  
10 associated with EBV infection; and multiple sclerosis which has been associated with  
herpes viral infections such as EBV and HHV-6. Further examples of such conditions or  
diseases are described in the background section above.

In addition to those conditions and diseases, the compounds of the present invention  
15 may also be used for the treatment or prophylaxis of cardiovascular diseases and  
conditions associated with herpes virus infections, in particular atherosclerosis,  
coronary artery disease and restenosis and specifically restenosis following angioplasty  
(RFA). Restenosis is the narrowing of the blood vessels which can occur after injury to  
the vessel wall, for example injury caused by balloon angioplasty or other surgical  
20 and/or diagnostic techniques, and is characterized by excessive proliferation of smooth  
muscle cells in the walls of the blood vessel treated. It is thought that in many  
patients suffering from RFA, viral infection, particularly by CMV and/or HHV-6 of the  
patient plays a pivotal role in the proliferation of the smooth muscle cells in the  
coronary vessel treated. Restenosis can occur following a number of surgical and/or  
25 diagnostic techniques, for example, transplant surgery, vein grafting, coronary by-pass  
grafting and, most commonly following angioplasty.

There is evidence from work done both in vitro and in vivo, indicating that restenosis  
is a multifactorial process. Several cytokines and growth factors, acting in concert,  
30 stimulate the migration and proliferation of vascular smooth muscle cells (SMC) and  
production of extracellular matrix material, which accumulate to occlude the blood

vessel. In addition growth suppressors act to inhibit the proliferation of SMC's and production of extracellular matrix material.

In addition, compounds of formula (I) may be useful in the treatment or prophylaxis  
5 of hepatitis B and hepatitis C viruses, human papilloma virus (HPV) and HIV.

The present invention provides a method for the treatment or prophylaxis of a viral infection in an animal such as a mammal (e.g., a human), particularly a herpes viral infection, which comprises administering to the animal a therapeutically effective  
10 amount of the compound of formula (I).

As used herein, the term "prophylaxis" refers to the complete prevention of infection, the prevention of occurrence of symptoms in an infected subject, or a decrease in severity or frequency of symptoms of viral infection, condition or disease in the

20

As used herein, the term "therapeutically effective amount" means an amount of a compound of formula (I) which is sufficient, in the subject to which it is administered, to treat or prevent the stated disease, condition or infection. The foregoing method is particularly useful for the treatment or prophylaxis of chronic fatigue syndrome and multiple sclerosis associated with latent infection with a herpes virus.

In another embodiment, the present invention provides a method for the treatment or prophylaxis of a cardiovascular condition such as atherosclerosis, coronary artery disease or restenosis (particularly restenosis following surgery such as angioplasty), which comprises administering to the animal a therapeutically effective antiviral amount of the compound of formula (I).

The present invention further provides a method for the treatment or prophylaxis of hepatitis B or hepatitis C viruses in an animal such as a mammal (e.g., a human), which comprises administering to the animal a therapeutically effective amount of the compound of formula (I).

The present invention further provides a method for the treatment or prophylaxis of human papilloma virus in an animal such as a mammal (e.g., a human), which comprises administering to the animal a therapeutically effective amount of the compound of formula (I).

The present invention further provides a method for the treatment or prophylaxis of HIV in an animal such as a mammal (e.g., a human), which comprises administering to the animal a therapeutically effective amount of the compound of formula (I).

The present invention also provides the use of the compound of formula (I) in the preparation of a medicament for the treatment or prophylaxis of a viral infection in an animal such as a mammal (e.g., a human), particularly a herpes viral infection; the use of the compound of formula (I) in the preparation of a medicament for the

treatment of conditions or disease associated with a herpes viral infection; and the use of the compound of formula (I) in the preparation of a medicament for the treatment or prophylaxis of hepatitis B or hepatitis C viruses, human papilloma virus and HIV. In particular, the present invention also provides the use of a compound of formula (I) in the preparation of a medicament for the treatment or prophylaxis of chronic fatigue syndrome or multiple sclerosis. In one embodiment, the present invention provides the use of a compound of formula (I) in the preparation of a medicament for the treatment or prophylaxis of cardiovascular disease, such as restenosis and atherosclerosis.

10

The compounds of formula (I) are conveniently administered in the form of pharmaceutical compositions. Such compositions may conveniently be presented for use in any conventional manner in admixture with one or more physiologically acceptable carriers or diluents.

15

While it is possible that compounds of the present invention may be therapeutically administered as the raw chemical, it is preferable to present the active ingredient as a pharmaceutical formulation. The carrier(s) must be "acceptable" in the sense of being compatible with the other ingredients of the formulation and not deleterious to the recipient thereof.

20

Accordingly, the present invention further provides for a pharmaceutical composition or formulation comprising a compound of formula (I) with one or more pharmaceutically acceptable carriers therefore and, optionally, other therapeutic and/or prophylactic ingredients.

25

The formulations include those suitable for oral, parenteral (including subcutaneous e.g. by injection or by depot tablet, intradermal, intrathecal, intramuscular e.g. by depot and intravenous), rectal and topical (including dermal, buccal and sublingual) administration although the most suitable route may depend upon for example the condition, age, and disorder of the recipient as well as the viral infection or disease

30

being treated. The formulations may conveniently be presented in unit dosage form and may be prepared by any of the methods well known in the art of pharmacy. All methods include the step of bringing into association the compound(s) ("active ingredient") with the carrier which constitutes one or more accessory ingredients. In  
5 general the formulations are prepared by uniformly and intimately bringing into association the active ingredient with liquid carriers or finely divided solid carriers or both and then, if necessary, shaping the product into the desired formulation.

Formulations suitable for oral administration may be presented as discrete units such  
10 as capsules, cachets or tablets (e.g. chewable tablets in particular for paediatric administration) each containing a predetermined amount of the active ingredient; as a powder or granules; as a solution or a suspension in an aqueous liquid or a non-aqueous liquid; or as an oil-in-water liquid emulsion or a water-in-oil liquid emulsion. The active ingredient may also be presented as a bolus, electuary or paste.

15 A tablet may be made by compression or moulding, optionally with one or more accessory ingredients. Compressed tablets may be prepared by compressing in a suitable machine the active ingredient in a free-flowing form such as a powder or granules, optionally mixed with other conventional excipients such as binding agents,  
20 (for example, syrup, acacia, gelatin, sorbitol, tragacanth, mucilage of starch or polyvinylpyrrolidone), fillers (for example, lactose, sugar, microcrystalline cellulose, maize-starch, calcium phosphate or sorbitol), lubricants (for example, magnesium stearate, stearic acid, talc, polyethylene glycol or silica), disintegrants (for example, potato starch or sodium starch glycollate) or wetting agents, such as sodium lauryl  
25 sulfate. Moulded tablets may be made by moulding in a suitable machine a mixture of the powdered compound moistened with an inert liquid diluent. The tablets may optionally be coated or scored and may be formulated so as to provide slow or controlled release of the active ingredient therein. The tablets may be coated according to methods well-known in the art.

Alternatively, the compounds of the present invention may be incorporated into oral liquid preparations such as aqueous or oily suspensions, solutions, emulsions, syrups or elixirs, for example. Moreover, formulations containing these compounds may be presented as a dry product for constitution with water or other suitable vehicle before use. Such liquid preparations may contain conventional additives such as suspending agents such as sorbitol syrup, methyl cellulose, glucose/sugar syrup, gelatin, hydroxyethylcellulose, carboxymethyl cellulose, aluminum stearate gel or hydrogenated edible fats; emulsifying agents such as lecithin, sorbitan mono-oleate or acacia; non-aqueous vehicles (which may include edible oils) such as almond oil, fractionated coconut oil, oily esters, propylene glycol or ethyl alcohol; and preservatives such as methyl or propyl p-hydroxybenzoates or sorbic acid. Such preparations may also be formulated as suppositories, e.g., containing conventional suppository bases such as cocoa butter or other glycerides.

Formulations for parenteral administration include aqueous and non-aqueous sterile injection solutions which may contain anti-oxidants, buffers, bacteriostats and solutes which render the formulation isotonic with the blood of the intended recipient; and aqueous and non-aqueous sterile suspensions which may include suspending agents and thickening agents.

The formulations may be presented in unit-dose or multi-dose containers, for example sealed ampoules and vials, and may be stored in a freeze-dried (lyophilised) condition requiring only the addition of a sterile liquid carrier, for example, water-for-injection, immediately prior to use. Extemporaneous injection solutions and suspensions may be prepared from sterile powders, granules and tablets of the kind previously described.

Formulations for rectal administration may be presented as a suppository with the usual carriers such as cocoa butter, hard fat or polyethylene glycol.

Formulations for topical administration in the mouth, for example buccally or sublingually, include lozenges comprising the active ingredient in a flavoured base

such as sucrose and acacia or tragacanth, and pastilles comprising the active ingredient in a base such as gelatin and glycerin or sucrose and acacia.

5 The compounds may also be formulated as depot preparations. Such long acting formulations may be administered by implantation (for example subcutaneously or intramuscularly) or by intramuscular injection. Thus, for example, the compounds may be formulated with suitable polymeric or hydrophobic materials (for example as an emulsion in an acceptable oil) or ion exchange resins, or as sparingly soluble derivatives, for example, as a sparingly soluble salt.

10

In addition to the ingredients particularly mentioned above, the formulations may include other agents conventional in the art having regard to the type of formulation in question, for example those suitable for oral administration may include flavouring agents.

15

It will be appreciated that the amount of a compound of the invention required for use in treatment will vary with the nature of the condition being treated and the age and the condition of the patient and will be ultimately at the discretion of the attendant physician or veterinarian. In general, however, doses employed for adult human treatment will typically be in the range of 0.02-5000 mg per day, preferably 20 100-1500 mg per day. The desired dose may conveniently be presented in a single dose or as divided doses administered at appropriate intervals, for example as two, three, four or more sub-doses per day. The formulations according to the invention may contain between 0.1-99% of the active ingredient, conveniently from 30-95% for 25 tablets and capsules and 3-50% for liquid preparations.

The compound of formula (I) for use in the instant invention may be used in combination with other therapeutic agents for example, non-nucleotide reverse transcriptase inhibitors, nucleoside reverse transcriptase inhibitors, protease inhibitors 30 and/or other antiviral agents. The invention thus provides in a further aspect the use of a combination comprising a compound of formula (I) with a further therapeutic

agent in the treatment of viral infections. Particular antiviral agents which may be combined with the compounds of the present invention include aciclovir, valaciclovir, famcyclovir, gancyclovir, docosanol, miribavir, amprenavir, lamivudine, zidovudine, and abacavir. Preferred antiviral agents for combining with the compounds of the present invention include aciclovir and valaciclovir. Thus the present invention provides in a further aspect, a combination comprising a compound of formula (I) and an antiviral agent selected from the group consisting of aciclovir and valaciclovir; the use of such combination in the treatment of viral infections and the preparation of a medicament for the treatment of viral infections, and a method of treating viral infections comprising administering a compound of formula (I) and an antiviral agent selected from the group consisting of aciclovir and valaciclovir.

When the compounds of formula (I) are used in combination with other therapeutic agents, the compounds may be administered either sequentially or simultaneously by any convenient route.

The combinations referred to above may conveniently be presented for use in the form of a pharmaceutical formulation and thus pharmaceutical formulations comprising a combination as defined above optionally together with a pharmaceutically acceptable carrier or diluent comprise a further aspect of the invention. The individual components of such combinations may be administered either sequentially or simultaneously in separate or combined pharmaceutical formulations.

When combined in the same formulation it will be appreciated that the two compounds must be stable and compatible with each other and the other components of the formulation and may be formulated for administration. When formulated separately they may be provided in any convenient formulation, in such a manner as are known for such compounds in the art.

When a compound of formula (I) is used in combination with a second therapeutic agent active against the viral infection, the dose of each compound may differ from

that when the compound is used alone. Appropriate doses will be readily appreciated by those skilled in the art.

25 defined above in connection with Scheme 1) comprises the steps of:

(a) reacting 2-chloro-6-picoline with a benzoylating agent of formula (II) to prepare a compound of formula (III);

(b) reacting the compound of formula (III) with a hydroxylamine source to prepare a compound of formula (IV);

30 (c) reacting the compound of formula (IV) with an acylating or sulfonylating agent to prepare a compound of formula (V);

- (d) rearranging the compound of formula (V) to prepare a compound of formula (VI);
- (e) acylating the compound of formula (VI) to prepare a compound of formula (VII);
- 5 (f) either:
- (1) replacing the C-7 halogen of the compound of formula (VII) with an amine; or
- (2) coupling the compound of formula (VII) with a metal compound of the formula  $R_g-M^3$  to prepare a compound of formula (VIII);
- 10 (g) reacting the compound of formula (VIII) with a dimethylformamide dialkyl acetal of formula  $(CH_3)_2NCH(OR_a)_2$  to prepare a compound of formula (IX); and
- (h) reacting the compound of formula (IX) with a compound of formula (X) to prepare the compounds of formula (I).
- 15 More specifically, compounds of formula (I) wherein Y is N,  $R^2$  is selected from the group consisting of H, alkyl, cycloalkyl, alkenyl, cycloalkenyl,  $-NR^7R^8$ ,  $-OR^7$ ,  $-OAr$ ,  $-S(O)_nR^7$ ,  $-S(O)_nAr$ ,  $-R^{10}NR^7R^8$ ,  $-R^{10}NR^7R^8$ , Ar, Het,  $-NH(CH_2)_mHet$  and  $-O(CH_2)_mHet$ ; and  $R^3$  and  $R^4$  are H can be prepared by reacting a compound of formula (IX) with a compound of formula (X).

wherein all variables are as defined above in connection with Scheme 1.

- This general method can be readily carried out by mixing a compound of formula (IX) with a compound of formula (X) in a suitable solvent, optionally in the presence of a
- 30 base (preferably when the amidine is in a salt form), and heating the reaction to about 50-150°C. Typical solvents include lower alcohols such as methanol, ethanol,

isopropanol, dimethylformamide, or the like. The base is typically a sodium alkoxide, potassium carbonate, or an amine base such as triethylamine. In one embodiment, the solvent is dimethylformamide and the base is potassium carbonate, or an amine base such as triethylamine.

5

Compounds of the formula (IX) may be conveniently prepared by reacting a compound of formula (VIII) with a dimethylformamide dialkyl acetal.

wherein all variables are as defined above in connection with Scheme 1.

15

Typical dimethylformamide dialkylacetal compounds for use in this method include but are not limited to dimethylformamide dimethylacetal and dimethylformamide di-*tert*-butylacetal. The reaction is carried out by mixing a compound of formula (VIII) with the dimethylformamide dialkyl acetal, optionally with heating.

20

Compounds of the formula (VIII) may be prepared by two general methods. According to one method, compounds of formula (VIII) are prepared from compounds of formula (VII) by replacement of the C-7 halogen (chloro is depicted in formula (VII) but other halogens are similarly useful) with an amine nucleophile.

25

wherein all variables are as defined above in connection with Scheme 1.

Typically the replacement is carried out by mixing the compound of formula (VII) with an amine nucleophile of formula  $R^{1a}$  where  $R^{1a}$  is selected from the group consisting of  $-NR^7R^8$ ,  $-NR^7Ay$ , Het,  $-NH(CH_2)_mHet$ , and  $-N(CH_2)_iAy$ ; and optionally heating the reaction.

5

The reaction can also be carried out via an adaptation of procedures found in the literature (Wolfe, J. P.; Buchwald, S. L. *J. Org. Chem.* 2000, 65, 1144) wherein a compound of the general formula (VII) is treated with an amine, a palladium (0) or nickel (0) source and a base in a suitable solvent. Suitable sources of palladium (0) include but are not limited to palladium(II) acetate and tris(dibenzylideneacetone) dipalladium (0). Typical bases for use in the reaction include, for example sodium *tert*-butoxide and cesium carbonate. Toluene is an example of a suitable solvent.

According to the second method, compounds of formula (VIII) are prepared from compounds of formula (VII) by coupling with metal compounds of the formula  $Rg-M^3$  wherein  $Rg$  is  $Ay$  or  $Het$  as defined above and  $M^3$  is  $B(OH)_2$ ,  $B(ORa)_2$ ,  $B(Ra)_2$ ,  $Sn(Ra)_3$ ,  $Zn$ -halide,  $Zn$ - $Ra$  or  $Mg$ -halide, wherein  $Ra$  is alkyl or cycloalkyl and halide is halo. This general method can be conveniently performed in an inert solvent, in the presence of a palladium (0) catalyst, optionally with heating. Preferably the reaction is performed by reacting equimolar amounts of a compound of the general formula (VII) with the metal compound of formula  $Rg-M^3$  or optionally adding an excess of the metal compound. The palladium catalyst is preferably present in 1-10 mol% compared to the compound of formula (VII). Palladium catalysts that may be used may include, but are not limited to, tetrakis(triphenylphosphine) palladium (0) dichlorobis(triphenyl-phosphine)palladium(II), and bis(diphenylphosphinoferrocene)-palladium (II) dichloride. Inert solvents for use in the reaction include but are not limited to, *N,N*-dimethylformamide, toluene, tetrahydrofuran, dioxane and 1-methyl-2-pyrrolidinone.

15

20

25

When the metal compound of formula  $Rg-M^3$  is an arylboronic acid or ester or an arylborinate, the reaction is more conveniently carried out by adding a base in a proportion equivalent to, or greater than, that of the metal compound.

- 5 Metal compounds of the formula  $Rg-M^3$  can be purchased from commercial sources or prepared either as discrete isolated compounds or generated *in situ* by using methods known to one skilled in the art. (Suzuki, A. *J. Organomet. Chem.* 1999, 576, 147; Stille, J. *Angew. Chem. Int. Ed. Engl.* 1986, 25, 508; Snieckus, V. *J. Org. Chem.* 1995, 60, 292.)

10

Compounds of the formula (VII) may be conveniently prepared from compounds of formula (VI) using an acylation procedure.

wherein all variables are as defined above in connection with Scheme 1.

- Typically the acylation is carried out by treating the compounds of formula (VI) with an acylating agent, optionally in the presence of an acid or Lewis acid catalyst in an inert solvent with optional heating. Typical acylating agents will be readily determined by those skilled in the art. One preferred acylating agent is acetic anhydride. Lewis acid catalysts are also known to those skilled in the art. One preferred Lewis acid catalyst for use in this reaction is boron trifluoride diethyl etherate. A suitable solvent is toluene.
- 20
- 25

Compounds of formula (VI) are conveniently prepared by rearranging an azirine compound of formula (V).

wherein all variables are as defined above in connection with Scheme 1.

The rearrangement of the azirines of formula (V) can be accomplished by heating a solution of the azirine of formula (V) in a suitable solvent at a temperature of about 160–200°C. Suitable inert solvents include, but are not limited to, 1-methyl-2-pyrrolidinone, and 1,2,4-trichlorobenzene. A more preferred method for rearrangement of the azirine of formula (V) to compounds of formula (VI) involves reacting the compound of formula (V) with ferrous chloride (FeCl<sub>2</sub>) or ferric chloride (FeCl<sub>3</sub>). This reaction is typically done in an inert solvent with heating. A preferred solvent for this reaction is 1,2-dimethoxyethane and the like.

10

15

Typically the azirines of formula (V) are prepared from oxime compounds of formula (IV) by treatment with acylating or sulfonylating agents in the presence of a base.

25 wherein all variables are as defined above in connection with Scheme 1.

Typical acylating or sulfonylating agents include but are not limited to, acetic anhydride, trifluoroacetic anhydride, methanesulfonyl chloride, toluenesulfonyl chloride and the like. Typical bases include, but are not limited to triethylamine, diisopropylethylamine, pyridine, or the like. The reaction may be carried out in an inert solvent such as for example, chloroform, dichloromethane, toluene or the like.

30

The oxime compounds of formula (IV) are readily prepared by treating ketone compounds of formula (III) with a hydroxylamine source, in a suitable solvent, and optionally with a base.

wherein all variables are as defined above in connection with Scheme 1.

- 10    Preferably the hydroxylamine is hydroxylamine hydrochloride and the base is an aqueous solution of sodium hydroxide. Suitable solvents include lower alcohols such as methanol, ethanol, or isopropanol.

- 15    The ketone compounds of formula (III) can be prepared by treatment of 2-chloro-6-picoline with a benzoylating agent of formula (II) in the presence of a base.

wherein all variables are as defined above in connection with Scheme 1.

- 20    Preferred benzoylating agents of formula (II) include, but are not limited to, benzoyl esters. An example of a suitable base is lithium bis(trimethylsilyl)amide in an inert solvent such as tetrahydrofuran. Ketones such as those of formula (III) can be readily prepared using procedures known to one skilled in the art and/or described in the literature (Cassity, R.P.; Taylor, L.T.; Wolfe, J.F. *J.Org. Chem.* 1978, 2286).

- 25    In addition to the foregoing process for preparing certain compounds of formula (I), the present invention also provides certain intermediate compounds for use in the preparation of such compounds of formula (I) according to the foregoing process. As one aspect, the present invention provides compounds of formula (III)

- 20      Generally, the process for preparing compounds of formula (I) (all formulas and variables having been defined above in connection with Scheme 4), comprises the following steps:
- a)      halogenating a compound of formula (XII) to prepare a compound of formula (XXII); and
- 25      b)      reacting the compound of formula (XXII) with a compound of formula (XXIV) to prepare the compound of formula (I).

More specifically, compounds of formula (I) can be prepared by reacting a compound of formula (XXII) with a compound of formula (XXIV).

wherein all variables are as defined above in connection with Scheme 4.

The reaction may be carried out in an inert solvent, in the presence of a palladium (0) or nickel (0) catalyst. The reaction may optionally be heated to about 50–150°C. Preferably the reaction is performed by reacting equimolar amounts of a compound of formula (XXII) with a Het-metal compound of formula (XXIV), but the reaction may also be performed in the presence of an excess of compound of the formula (XXIV). The palladium or nickel catalyst is preferably present in 1–10 mol% compared to the compound of formula (XXII). Examples of suitable palladium catalysts include but are not limited to, tetrakis(triphenylphosphine)palladium (0), dichlorobis(triphenylphosphine)palladium(II), and bis(diphenylphosphinoferrocene)palladium (II) dichloride. Suitable solvents include but are not limited to, *N,N*-dimethylformamide, toluene, tetrahydrofuran, dioxane, and 1-methyl-2-pyrrolidinone. When the Het-metal compound of formula (XXIV) is an arylboronic acid or ester or an arylborinate the reaction is more conveniently carried out by adding a base in a proportion equivalent to, or greater than, that of the compound of formula (XXIV). Het-metal compounds of formula (XXIV) may be obtained from commercial sources or prepared either as discreet isolated compounds or generated *in situ* using methods known to one skilled in the art. (Suzuki, A. *J. Organomet. Chem.* 1999, 576, 147; Stille, J. *Angew. Chem. Int. Ed. Engl.* 1986, 25, 508; Snieckus, V. *J. Org. Chem.* 1995, 60, 292.)

Compounds of formula (XXII) can be prepared from compounds of formula (XII) by a halogenation procedure.

wherein all variables are as defined above in connection with Scheme 4.

Typically, the halogenation reaction is carried out by subjecting the compounds of formula (XII) to a halogenating agent in a suitable solvent. Suitable halogenating agents include but are not limited to, *N*-bromosuccinimide, trialkylammonium tribromides, bromine, *N*-chlorosuccinimide, *N*-iodosuccinimide, iodine monochloride, and the like. Suitable solvents include, for example, *N,N*-dimethylformamide, tetrahydrofuran, dioxane, 1-methyl-2-pyrrolidinone, carbon tetrachloride, toluene, dichloromethane, diethyl ether, or the like.

10  
15

In the embodiments wherein the compound of formula (XXII) is defined where  $R^1$  is chloro, (i.e., compounds of formula (XXII-A)) and compounds of formula (I) where  $R^1$  is other than chloro are desired, it may be desirable to convert the compounds of formula (XXII-A) to compounds of formula (XXII-B) prior to reacting with the Het-metal of formula (XXIV). Compounds of formula (XXII-B) can be conveniently and surprisingly prepared from compounds of formula (XXII-A) by an amination procedure.

20

wherein  $R^{1b}$  is  $-\text{NR}^7\text{R}^8$  or  $-\text{NR}^7\text{Ay}$  and all other variables are as defined above in connection with Scheme 4.

The ability to replace the chlorine in preference to the bromine of the heterocyclic ring system is unexpected. Preferably, a compound of formula (XXII-A) is reacted with

30

a primary or secondary amine having substitutions corresponding to those of R<sup>1</sup>, in the presence of a palladium catalyst and a base. The procedure represents a modification of procedures found in the literature (Wolfe, J. P.; Buchwald, S. L. *J. Org. Chem.* 2000, 65, 1144) wherein amines are cross-coupled to aryl halides. Suitable palladium (0) catalysts include palladium(II) acetate and tris(dibenzylideneacetone) dipalladium (0). Suitable bases include sodium *tert*-butoxide and cesium carbonate. Solvents such as toluene may be employed.

In addition to the foregoing process for preparing compounds of formula (I), the present invention also provides certain intermediate compounds for use in the preparation of compounds of formula (I) according to the foregoing process. Thus, as one aspect, the present invention provides compounds of formula (XXII)

wherein all variables are as defined above.

Another method for the preparation of the compounds of Formula (XXII) in this invention is the decarboxylation/bromination sequence as shown below.

wherein R<sup>1</sup> and R<sup>5</sup> are as defined above in connection with Scheme 4.

This reaction can be achieved by treatment of a compound of formula (XXV), dissolved in a suitable solvent, with a base followed by a brominating agent and stirring the mixture at, or about, 25°C until the reaction is judged complete by the disappearance

of (XXV). Suitable solvents include, but are not limited to, dimethylformamide, dimethylacetamide, dioxane and the like. Conveniently the base is sodium hydrogen carbonate and the brominating agent can be, for example, N-bromosuccinimide.

5 Compounds of formula (XXV) can be prepared most readily by simple hydrolysis of lower alkyl esters of formula (XXVI). Esters such as (XXVI) may be prepared by a cycloaddition reaction between compounds of formula (XXVII) and acetylenes of formula (XXVIII), as summarized below.

wherein R<sup>1</sup> and R<sup>5</sup> are as defined above in connection with Scheme 4.

20 Cycloaddition reactions such as these are commonly known as [3+2] dipolar  
cycloaddition reactions. Conveniently the reaction may be carried out by mixing the  
reactants (XXVII) and (XXVIII), in equimolar amounts, in an inert solvent and adding a  
suitable base. The mixture is then stirred at between 20-100°C until the reaction is  
judged complete by the disappearance of one of the reactants. Preferred solvents  
25 include but are not limited to acetonitrile, dioxane, tetrahydrofuran,  
dimethylformamide and the like. Preferred bases include non-nucleophilic amines  
such as 1,8-diazabicyclo[5.4.0]undec-7-ene, 1,5-diazabicyclo[4.3.0]non-5-ene, 1,4-  
diazabicyclo[2.2.2]octane and the like.

30 Esters such as those of Formula (XXVI) can be conveniently hydrolyzed to their corresponding carboxylic acids by standard hydrolysis conditions employed to effect

- similar hydrolysis reactions (Larock, Comprehensive Organic Transformations, 1989, 981). For example, treatment of a solution of a compound of formula (XXVI) in a lower alcohol, for example methanol, with sodium hydroxide followed by heating the mixture for an appropriate time gives the compound of formula (XXV). Compounds of formula (XXVII) are aminated pyridine derivatives and are either commercially available or can be conveniently prepared by reacting a suitable pyridine with an aminating reagent such as O-(mesitylsulfonyl)hydroxylamine, O-(diphenylphosphinyl)hydroxylamine, hydroxylamine-O-sulfonic acid and the like.
- 10 Acetylenic esters such as those of general formula (XXVIII) are either known compounds or can be prepared by methods described in the literature. Preferred methods include the reaction of acetylenes such as those of formula (XXIX) with a suitable base to generate an acetylenic anion and subsequent reaction of the anion with an alkoxycarbonylating agent, as summarized below.

wherein  $R^5$  is as defined above in connection with Scheme 4.

- 25 Preferably the acetylene (XXIX) is dissolved in an inert solvent, such as tetrahydrofuran, and the solution is cooled to about  $-75^{\circ}\text{C}$ . A non-nucleophilic base is added in sufficient quantity to effect deprotonation of the acetylene (XXIX). The preferred bases include, but are not limited to, n-butyllithium, lithium diisopropylamide, sodium bis(trimethylsilyl)amide and the like. To the reaction mixture is then added a reagent capable of reacting with an anion to introduce an
- 30

alkoxycarbonyl group. Preferred reagents include, but are not limited to, methyl chloroformate, ethyl chloroformate, benzyl chloroformate and the like.

Arylalkynes such as (XIX) are either known compounds or can be prepared by literature methods such as those described in, for example, Negishi, E. *J. Org. Chem.* 1997, 62, 8957.

Compounds of general formula (XXII) can also be prepared via a number of other convenient routes. Disubstituted acetylenes as represented by formula (XXX) can be treated with an aminating agent, optionally in the presence of a base, to give compounds of general formula (XII). The aminating agent is, preferably, O-(mesitylsulfonyl)hydroxylamine and the base is potassium carbonate.

wherein R<sup>1</sup> and R<sup>5</sup> are as defined above in connection with Scheme 4.

20 Disubstituted acetylenes such as (XXX) are readily prepared by a palladium catalyzed coupling reaction between aryl acetylenes and 2-halopyridines using methods described in the literature (Yamanake *et. al*, *Chem. Pharm. Bull.* 1988, 1890).

A compound of formula (XII) can be brominated to give a compound of formula (XXII) as outlined previously.

25

As will be apparent to those skilled in the art, the compounds of formula (I) may be converted to other compounds of formula (I) using techniques well known in the art. For example, one method of converting compounds of formula (I) to other compounds of formula (I) comprises a) oxidizing the compound of formula (I-A) to prepare a compound of formula (I-B) and then b) optionally reacting a compound of formula (I-

30

- B) with an oxygen or amine nucleophile of formula  $R^2$ , wherein  $R^2$  is selected from the group consisting of  $-NR^7R^8$ ,  $-OR^7$ ,  $-OAr$ , Het attached through N,  $-NH(CH_2)_m$ Het and  $-O(CH_2)_m$ Het to produce a compound of formula I wherein  $R^2$  is selected from the group consisting of  $-NR^7R^8$ ,  $-OR^7$ ,  $-OAr$ , Het attached through N,  $-NH(CH_2)_m$ Het and  $-O(CH_2)_m$ Het.

- wherein  $n'$  is 1 or 2 and all other variables are as defined according to any of the processes described above.

- More specifically, compounds of formula (I) wherein Y is N or CH can be prepared by reacting a compound of formula (I-B) (i.e., compounds of formula I wherein  $R^2$  is  $S(O)_{n'}R^7$  where  $n'$  is 1 or 2) with an oxygen or amine nucleophile of formula  $R^2$ , wherein  $R^2$  is selected from the group consisting of  $-NR^7R^8$ ,  $-OR^7$ ,  $-OAr$ , Het attached through N,  $-NH(CH_2)_m$ Het and  $-O(CH_2)_m$ Het. The reaction may be carried out neat or in a suitable solvent and may be heated to 50-150°C. Typically the solvent is a lower alcohol such as methanol, ethanol, isopropanol or the like, or solvent such as *N,N*-dimethylformamide or tetrahydrofuran, or the like. Optionally a base may be used to facilitate the reaction. Typically the base can be potassium carbonate, or an amine base such as triethylamine.

- Compounds of formula (I-B) may be conveniently prepared by reacting a compound of formula (I-A) (i.e., compounds of formula I wherein  $R^2$  is  $S(O)_nR^7$  where  $n$  is 0) with an oxidizing agent in an inert solvent, optionally in the presence of a base.

wherein the variables are as defined above.

Typically the oxidizing agent is a peracid such as *m*-chloroperbenzoic acid or the like optionally with a base such as sodium bicarbonate. Careful monitoring of the stoichiometry between the oxidizing agent and the substrate allows the product distribution between sulfoxide ( $n'=1$ ), and sulfone ( $n'=2$ ) to be controlled. Suitable solvents include but are not limited to, dichloromethane, chloroform or the like.

Compounds of formula (I-A) are prepared by methods described above wherein  $R^2=SR^7$  from from the reaction of compounds selected from the group consisting of compounds of formula (XVI), compounds of formula (IX) and compounds of formula (XX) with a compound of formula (X-A) (i.e., the compound of formula (X) wherein  $R^2$  is  $SR^7$ ). The requisite compound of formula (X-A) can be obtained from commercial sources or prepared by methods known to one skilled in the art.

Another particularly useful method for converting compounds of formula (I) to other compounds of formula (I) comprises reacting a compound of formula (I-C) (i.e., a compound of formula (I) wherein  $R^2$  is fluoro) with an amine, and optionally heating the mixture to 50-150°C to prepare a compound of formula (I-D) (i.e., a compound of formula (I) wherein  $R^2$  is  $-NR^7R^8$ ).

wherein all variables are as defined in connection with any of the processes described above.

- 10 This procedure may be carried out by mixing a compound of formula (I-C) in an amine neat, or in a suitable solvent with an excess of amine to produce a compound of formula (I-D). Typically the solvent is a lower alcohol such as methanol, ethanol, isopropanol or the like. Other suitable solvents may include *N,N*-dimethylformamide, 1-methyl-2-pyrrolidine or the like.

15

As a further example, compounds of formula (I-E) may be converted to compounds of formula (I-F) using either of two methods.

25 wherein  $\text{M}^3$  is  $\text{B}(\text{OH})_2$ ,  $\text{B}(\text{ORa})_2$ ,  $\text{Sn}(\text{Ra})_3$ ,  $\text{Zn}$ -halide,  $\text{Zn}$ -Ra or  $\text{Mg}$ -halide where Ra is alkyl or cycloalkyl, halide is halo and all other variables are as defined in connection with any process described above.

- 30 Such method can be carried out using the reaction and conditions described above in connection with Scheme 1 and the conversion of compounds of formula VII to compounds of formula VIII. Thus, the present invention provides a process for converting compounds of formula (I-E) to compounds of formula (I-F) which

comprises either: (1) replacing the C-7 halogen of the compound of formula (I-E) with an amine; or (2) coupling the compound of formula (I-E) with an aryl metal of the formula  $Ay-M^3$  where  $M^3$  is  $B(OH)_2$ ,  $B(ORa)_2$ ,  $B(Ra)_2$ ,  $Sn(Ra)_3$ , Zn-halide; Zn-Ra or Mg-halide.

5

Based upon this disclosure and the examples contained herein one skilled in the art can readily convert compounds of formula (I) or a pharmaceutically acceptable salt, solvate, or physiologically functional derivative thereof into other compounds of formula (I), or salts, solvates or physiologically functional derivatives thereof.

10

The present invention also provides radiolabeled compounds of formula (I). Radiolabeled compounds of formula (I) can be prepared using conventional techniques. For example, radiolabeled compounds of formula (I) can be prepared by reacting the compound of formula (I) with tritium gas in the presence of an appropriate catalyst to produce radiolabeled compounds of formula (I).

15

In one preferred embodiment, the compounds of formula (I) are tritiated.

20

The radiolabeled compounds of formula (I) are useful in assays for the identification of compounds for the treatment or prophylaxis of viral infections such as herpes viral infections. Accordingly, the present invention provides an assay method for identifying compounds which have activity for the treatment or prophylaxis of viral infections such as herpes viral infections, which method comprises the step of specifically binding the radiolabeled compound of formula (I) to the target protein.

25

More specifically, suitable assay methods will include competition binding assays. The radiolabeled compounds of formula (I) can be employed in assays according to the methods conventional in the art.

Reagents are commercially available or are prepared according to procedures in the literature. Example numbers refer to those compounds listed in the tables above.  $^1H$  and  $^{13}C$  NMR spectra were obtained on

Varian Unity Plus NMR spectrophotometers at 300 or 400 MHz, and 75 or 100 MHz respectively.  $^{19}\text{F}$  NMR were recorded at 282 MHz. Mass spectra were obtained on Micromass Platform, or ZMD mass spectrometers from Micromass Ltd. Altrincham, UK, using either Atmospheric Chemical Ionization (APCI) or Electrospray Ionization (ESI). Analytical thin layer chromatography was used to verify the purity of some intermediates which could not be isolated or which were too unstable for full characterization, and to follow the progress of reactions. Unless otherwise stated, this was done using silica gel (Merck Silica Gel 60 F254). Unless otherwise stated, column chromatography for the purification of some compounds, used Merck Silica gel 60 (230-400 mesh), and the stated solvent system under pressure. All compounds were characterized as their free-base form unless otherwise stated. On occasion the corresponding hydrochloride salts were formed to generate solids where noted.

a) Tissue Culture and HSV infection.

Vero 76 cells were maintained in MEM with Earle's salts, L-glutamine, 8% FBS (Hyclone, A-1111-L) and 100 units/mL Penicillin-100 µg/mL Streptomycin. For assay conditions, FBS was reduced to 2%. Cells are seeded into 96-well tissue culture plates at a density of  $5 \times 10^4$  cells/well after being incubated for 45 min at 37°C in the presence of HSV-1 or HSV-2 (MOI = 0.001). Test compounds are added to the wells and the plates are incubated at 37°C for 40- 48 hours. Cell lysates are prepared as follows: media was removed and replaced with 150 µL/well 0.2 N NaOH with 1% Igepal CA 630 or NP-40. Plates were incubated up to 14 days at room temperature in a humidified chamber to prevent evaporation.

(b) Preparation of detection DNA.

For the detection probe, a gel-purified, digoxigenin-labeled, 710-bp PCR fragment of the HSV UL-15 sequence was utilized. PCR conditions included 0.5 µM primers, 180 µM dTTP, 20 µM dUTP-digoxigenin (Boehringer Mannheim 1558706), 200 µM each of dATP, dCTP, and dGTP, 1X PCR Buffer II (Perkin Elmer), 2.5 mM MgCl<sub>2</sub>, 0.025 units/µL of AmpliTaq Gold polymerase (Perkin Elmer), and 5 ng of gel-purified HSV DNA per 100 µL. Extension conditions were 10 min at 95°C, followed by 30 cycles of 95°C for 1 min, 55°C for 30 sec, and 72°C for 2 min. The amplification was completed with a 10-min incubation at 72°C. Primers were selected to amplify a 728 bp probe spanning a section of the HSV1 UL15 open reading frame (nucleotides 249-977).

Single-stranded transcripts were purified with Promega M13 Wizard kits. The final product was mixed 1:1 with a mixture of 6 M GuSCN, 100 mM EDTA and 200 µg/mL herring sperm DNA and stored at 4°C.

(c) Preparation of capture plates.

The capture DNA plasmid (HSV UL13 region in pUC) was linearized by cutting with Xba I, denatured for 15 min at 95°C and diluted immediately into Reacti-Bind DNA Coating Solution (Pierce, 17250, diluted 1:1 with TE buffer, pH 8) at 1 ng/µL. 75 µL/well were added to Corning (#3922 or 9690) white 96-well plates and incubated at room temperature for at least 4 hrs before washing twice with 300 µL/well 0.2X

SSC/0.05% Tween-20 (SSC/T buffer). The plates were then incubated overnight at room temperature with 150  $\mu$ L/well 0.2 N NaOH, 1% IGEPAL and 10  $\mu$ g/mL herring sperm DNA.

5 (d) Hybridization.

Twenty-seven (27)  $\mu$ L of cell lysate was combined with 45  $\mu$ L of hybridization solution (final concentration: 3M GuSCN, 50 mM EDTA, 100  $\mu$ g/ml salmon sperm DNA, 5X Denhardt's solution, 0.25X APE, and 5 ng of the digoxigenin-labeled detection probe). APE is 1.5 M  $\text{NH}_4$ -acetate, 0.15 M ammonium phosphate, and 5 mM EDTA adjusted to  
 10 pH 6.0. Mineral oil (50  $\mu$ L) was added to prevent evaporation. The hybridization plates were incubated at 95°C for 10 minutes to denature the DNA, then incubated at 42°C overnight. The wells were washed 6X with 300  $\mu$ L/well SSC/T buffer then incubated with 75  $\mu$ L/well anti-digoxigenin- HRP-conjugated antibody (Boehringer Mannheim 1207733, 1:5000 in TE) for 30 min at room temperature. The wells were washed 6X  
 15 with 300  $\mu$ L/well with PBS/0.05% Tween-20 before 75  $\mu$ L/well SuperSignal LBA substrate (Pierce) was added. The plates were incubated at room temperature for 30 minutes and chemiluminescence was measured in a Wallac Victor reader.

# INTERNATIONAL SEARCH REPORT

International application No.  
PCT/US 01/44231

## Box I Observations where certain claims were found unsearchable (Continuation of item 1 of first sheet)

This International Search Report has not been established in respect of certain claims under Article 17(2)(a) for the following reasons:

1. ☒ Claims Nos.:  
because they relate to subject matter not required to be searched by this Authority, namely:  
  
Although claims 21 - 23 are directed to a method of treatment of the human/animal body, the search has been carried out and based on the alleged effects of the compound/composition.
2. ☐ Claims Nos.:  
because they relate to parts of the International Application that do not comply with the prescribed requirements to such an extent that no meaningful International Search can be carried out, specifically:
3. ☐ Claims Nos.:  
because they are dependent claims and are not drafted in accordance with the second and third sentences of Rule 6.4(a).

## Box II Observations where unity of invention is lacking (Continuation of item 2 of first sheet)

This International Searching Authority found multiple inventions in this international application, as follows:

1. ☐ As all required additional search fees were timely paid by the applicant, this International Search Report covers all searchable claims.
2. ☐ As all searchable claims could be searched without effort justifying an additional fee, this Authority did not invite payment of any additional fee.
3. ☐ As only some of the required additional search fees were timely paid by the applicant, this International Search Report covers only those claims for which fees were paid, specifically claims Nos.:
4. ☐ No required additional search fees were timely paid by the applicant. Consequently, this International Search Report is restricted to the invention first mentioned in the claims; it is covered by claims Nos.:

### Remark on Protest

- ☐ The additional search fees were accompanied by the applicant's protest.
- ☐ No protest accompanied the payment of additional search fees.
